Testosterone. It’s what makes a man a man. Not having enough of it can lead to a host of issues like decreased sex drive, a loss of muscle mass and strength, increased body fat, even gynecomastia (male breast enlargement).

And, unfortunately, it’s extremely common for men’s testosterone levels to start decreasing as they age. But Limitless Worldwide’s™ Clinical Strength Testrodyne Complex formula was designed to help support the body’s own production of testosterone.* Its key compound was shown in a clinical trial to significantly increase mean serum testosterone levels in healthy adult men by 42.1%*... in just 12 days. That’s right. A double-blind, placebo-controlled clinical trial showed Clinical Strength Testrodyne Complex’s key compound increased mean, serum testosterone levels by an amazing 42.1% in just 12 days. Finally... a testosterone support supplement that really works!

But there’s more. Even three days after study subjects stopped using the complex their serum testosterone levels were still significantly increased.* So not only does Clinical Strength Testrodyne Complex increase testosterone levels... it also has a lasting effect. And it does all this without expensive injections or greasy topical gels... just take three easy-to-swallow tablets every morning, and that’s it.

Healthy testosterone levels are associated with a heightened sex drive, enhanced energy, and improved muscle growth. So if you’re ready to feel like a man again... you need Limitless Worldwide’s Clinical Strength Testrodyne Complex.

Remember: Although our Clinical Strength Testrodyne Complex is a dietary supplement that supports the body’s own production of testosterone, it WILL provide significant support for “normal” testosterone release.* Therefore, before using Clinical Strength Testrodyne Complex you should check with your doctor to ensure you are in overall good health.

42.1% INCREASE IN SERUM TESTOSTERONE OVER BASELINE*

Science... Beyond Testimonials*
Men and Testosterone

Testosterone is a steroid hormone synthesized from cholesterol and occurs in both bound and unbound (free) forms in the body. Though present in small amounts in females, this hormone determines sexuality in men and hence is considered the male sex hormone. Low testosterone levels in men can have adverse effects such as reduced libido, decreased muscle mass and strength, loss of body hair, gynecomastia (the term for abnormal mammary gland development in men relating to breast enlargement) and impaired spermatogenesis. The levels of testosterone in men are shown to decrease with increasing age. Total testosterone levels are said to decline at a rate of 1.6% per year, and levels of bioavailable testosterone are reduced by approximately 2-3% per year according to the longitudinal results obtained from the Massachusetts Male Aging Study.

Testosterone levels influence body composition as well as the balance of lipid metabolism in the body. For instance, in testosterone-deficient (hypogonadal) men, physician-administered testosterone therapy has been shown to improve lipid profiles by balancing cholesterol, blood sugar and insulin. Testosterone-deficient men are also known to have reduced lean body mass, muscle strength, and increased body mass index (BMI). In these men, testosterone therapy leads to increases in lean body mass, muscle mass and strength, as well as a reduction in body fat mass. Supra-physiological (or higher-than-normal) doses of testosterone are shown to increase fat-free mass, muscle size, and muscle strength in normal men as well. Interestingly, combined reductions in testosterone and human growth hormone (hGH) secretion have been shown to correlate with stages of obesity in men. Physician-administered testosterone treatment in testosterone-deficient men has been shown to increase hGH secretion. Furthermore, testosterone administration in normal men also increases hGH secretion, signifying the association between the endocrine axes of these two hormones.

Clinical Strength Testrodyne: A Testosterone-Boosting COMPLEX

Clinical Strength Testrodyne Complex was developed with a key compound shown in a double-blind, placebo-controlled clinical trial to help maintain optimal testosterone levels in healthy adult males compared to placebo group over the time course of a 15 day study. Specifically, after using the compound for only 6 days, serum testosterone was already found to be 1.15-fold higher than basal levels, and after 12 days, serum testosterone levels had increased in 87% of subjects by an amazing average rise of 42.1%. Furthermore, 3 days after suspending use of the compound in Clinical Strength Testrodyne Complex, serum testosterone was still significantly increased compared with the basal levels, showing a lasting effect.*

Conclusion

Clinical Strength Testrodyne Complex’s super-potent testosterone-boosting compound increases serum testosterone levels an average of 42.1% after only 12 days of use, and with a lasting effect even 3 days after the suspension of use.* This may be the most potent and clinically effective testosterone-maintenance dietary supplement available over the counter.

Testrodyne Complex

DIRECTIONS: Take 3 tablets daily with breakfast. Individual results will vary.

WARNING: Do not exceed suggested daily serving. For adult males only. Before consuming Clinical Strength Testrodyne Complex consult your physician. Do not use Clinical Strength Testrodyne Complex if you have any pre-existing medical condition, including but not limited to: high or low blood pressure, cardiac arrhythmia, stroke, heart, liver, or thyroid disease, anxiety, depression, seizure disorder, psychiatric disease, diabetes, pemiocous anemia, difficulty urinating due to prostate enlargement, or if you are taking an MAO inhibitor or any other medication. Do not exceed suggested daily serving. Discontinue use if sleeplessness, tremors, dizziness, nervousness, headache, or heart palpitations occur. Keep out of reach of children. Use only as directed.

CAUTION: Increased testosterone levels may increase sexual arousal, over-confidence, and aggression.
